

SCOTTIE RESOURCES HITS MULTIPLE HIGH-GRADE GOLD INTERCEPTS AT BLUEBERRY CONTACT ZONE INCLUDING 34.3 G/T GOLD OVER 3.30 METRES AND 9.97 G/T GOLD OVER 9.70 METRES

Vancouver, BC – January 27, 2026 – Scottie Resources Corp. (“**Scottie**” or the “**Company**”) (TSXV: SCOT OTCQB: SCTSF FSE:SR80) is pleased to report new assays from its 2025 drilling of various zones within the Blueberry Contact Zone, at the Scottie Gold Mine Project (“**Scottie Gold Mine**” or the “**Project**”). The road-accessible Project is located 35 kilometres north of Stewart, BC, and is the subject of a newly released Preliminary Economic Assessment (“**PEA**”) entitled Scottie Gold Mine Project (Bird et al., October 28, 2025, Scottie Gold Mine Project, SEDAR+).

2025 drilling continues to deliver excellent results at the Project. Hole SR25-420 intersected **34.3 grams per tonne “g/t” gold over 3.30 metres**, including a high-grade interval of **90.8 g/t gold over 1.0 metres** within the Lemoffe vein zone. Hole SR25-424 intersected **9.97 g/t gold over 9.70 metres**, including **21.1 g/t gold over 2.45 metres**. Of the 27,000 metres drilled in 2025, only ~16,000 metres have been reported to date.

“These results reinforce the strength and continuity of high-grade gold mineralization at Blueberry,” stated Dr. Thomas Mumford, President. “With 27,000 meters drilled in 2025 we are well positioned to continue expanding this high-grade predictable system. Hole SR25-424 is a great example of the efficiency of our targeting at Blueberry, delivering multiple strong intercepts from separate vein zones. Fully funded for 2026, we look forward to continuing to define additional mineralization.”

Highlights:

- **Multiple high-grade intercepts from multiple vein zones within individual drill holes**
- **Near surface high-grade mineralization**, including 6.44 g/t gold over 14 metres (starting at a drill core length of 35 m; Figs. 1,2,5)
- Results **de-risk and strengthen** the recently released PEA by improving confidence in mine planning and future development scenarios
- **Strong grades** reported across all major Blueberry Contact vein zones reinforce confidence in a **robust, predictable mineralized system**

Table 1: Highlight results from new drill assays (uncut) – Blueberry Contact Zone

Drill Hole		From (m)	To (m)	Width* (m)	Gold (g/t)	Silver (g/t)	Sub Zone

About the Scottie Gold Mine Project

Over the past six years, exploration at the Scottie Gold Mine Project has delivered exceptional results — highlighted by the discovery of four new high-grade zones (Blueberry Contact Zone, Domino, D-Zone, and P-Zone) and the expansion of several historically drilled targets (Scottie Gold Mine, C-Zone, Bend Vein, and Stockwork).

A clear spatial relationship has emerged between these high-grade zones and the contact with the Jurassic-aged Texas Creek Plutonic Suite, providing a powerful framework for ongoing targeting. Detailed geological, structural, mineralogical, and geochemical studies now point to a shared mineralizing event across the property — linking the deposits into a broader, interconnected system with significant growth potential.

The Blueberry Contact Zone, located 2 km northeast of the 100%-owned past producing Scottie Gold Mine in BC's Golden Triangle, has rapidly advanced from a lightly drilled high-grade vein showing into a major growth target. The target was significantly advanced during Scottie's 2019 drill program when an interval was intersected in a new N-S oriented zone adjacent to the main Blueberry Vein. The drill results received from 2020 - 2024, coupled with surficial mapping and sampling suggest that the N-S mineralized trend is a controlling structure that hosts an array of SW-trending, sub-parallel, sulphide-rich veins that obliquely crosscut it which host high-grade gold. As of the end of 2024, the extent of the N-S zone, defined by the contact between andesite and siltstone units of the Hazelton Formation and the presence of the cross-cutting sulfide-rich structures, has a drilled strike length of >1,550 metres and has been tested to >525 metres depth. The Blueberry Contact

Zone is located on the Granduc Road, 20 kilometres north of the Ascot Resources' Premier Mine. Newmont's Brucejack Mine is located 25 kilometres to the north.

The Company has recently completed a PEA which evaluates a low-capital DSO operation to deliver a gold-rich gravel product to Asian copper/precious metals smelters. At a gold price of US\$2600/oz the project estimates an after-tax NPV(5%) of \$215.8 M CAD with an IRR of 60.3%. By design, the operation will eliminate the need for a gold processing plant and tailings facility, thereby significantly reducing the capital required and resulting in a minimal environmental footprint, resulting in an initial capital cost of \$128.6 M CAD. The project envisages a shallow open pit on the Blueberry Zone to start, followed by underground production from both Blueberry and the past-producing Scottie Gold Mine. The PEA also evaluates a toll milling scenario through the nearby Premier Mill, which results in an after-tax NPV(5%) \$380.1 M CAD and an IRR 89.9%.

Scottie's 2025 Bulk Sample program exemplifies the unique characteristics of this mining project, and its ability to rapidly progress. From permitting to mining, crushing, transporting, shipping and sale of the product, the program was executed in under a year, generating an estimated \$9M in new revenue. With this proven pathway, Scottie's has confidence in the simplicity and efficiency of its DSO model.

Quality Assurance and Control

Results from samples taken during the 2025 field season were analyzed at SGS Minerals in Burnaby, BC. The sampling program was undertaken under the direction of Dr. Thomas Mumford. The majority of drill core was NQ in diameter, with select holes of HQ size primarily taken for geomechanical purposes. Prior to sampling drill core was cut in half lengthwise, with half sent for assay and the remaining half kept in Stewart, BC. Standards, blanks, and duplicate samples were taken at intervals and frequencies that meet or exceed industry best practices. A secure chain of custody is maintained in transporting and storing all samples. Gold was assayed using a fire assay with atomic absorption spectrometry and gravimetric finish when required (+9 g/t gold). Analysis by four acid digestion with multi-element ICP-AES analysis was conducted on all samples with silver and base metal over-limits being re-analyzed by emission spectrometry.

Dr. Thomas Mumford, P.Geo., non-independent President of the Company, a qualified person under National Instrument 43-101, has reviewed and approved the technical information contained in this news release on behalf of the Company.

ABOUT SCOTTIE RESOURCES CORP.

Scottie Resources holds 100% interest in the Scottie Gold Mine Property, which includes the high-grade, past-producing Scottie Gold Mine and the adjacent Blueberry Contact Zone. The Company also owns a 100% interest in the Georgia Project, host to the past-producing Georgia River Mine, as well as the Cambria, Sulu, and Tide North properties. In total, Scottie controls approximately 58,500 hectares of highly prospective mineral claims within the Stewart Mining Camp in British Columbia's Golden Triangle—one of the world's most prolific mineralized districts.

Scottie's current resource estimate on the Scottie Gold Mine Project includes a total of 703,000 gold ounces at an average grade of 6.1 g/t (Inferred category) in 3.6 million tonnes, highlighting the development potential for a significant near-surface, high-grade deposit. The Company's strategy is to continue expanding this resource and to define additional mineralization around past-producing mines through systematic drilling and surface exploration.

The Company has recently completed a PEA for the Scottie Gold Mine. The PEA outlines a robust Direct-Ship Ore (DSO) development scenario with strong economics and significant upside through a potential toll-milling option utilizing excess capacity at the nearby Premier mill. The base case DSO project delivers an after-tax NPV(5%) of \$215.8–\$668.3 million at gold prices of US\$2,600–\$4,200/oz, respectively. Under the toll-milling scenario, project economics improve substantially, with an after-tax NPV(5%) of \$380.1–\$831.7 million (no agreement currently in place). The PEA estimates initial capital costs of \$128.6 million, average annual production of ~65,400 oz gold over seven years, and a payback period of 1.7 years for the after-tax DSO case—reduced to just 0.9 years under the toll-milling opportunity at US\$2,600/oz.
